# **INDEPENDENT SLATE SUPPLIES**

Independent Slate Supplies (ISS) have been established for over 35 years and are specialists in the import and distribution of high quality, competitively priced roofing and flooring products and their associated accessories.

Whether you are a roofing contractor, a developer, a homeowner, a general builder, an architect or a merchant, please do not hesitate to contact us so we can discuss your requirements. We can assist you in selecting the most appropriate product for your planned development, which can be supplied via our network of merchants and stockists throughout the UK.

# Natural Roofing Slate: CABRERA GREY

Origin: Sourced from the North West region of Spain.

#### Colour: Dark Grey

Texture and Appearance: A textured surface with traditional dressed edges.

Quality: ISS provide the Cabrera Grey slate in a prime quality, having been through the most stringent selection process, whilst also being tested to the current British and European requirements.

Slates Thickness: The Cabrera Grey is produced in a heavy grade (7-9mm), which is suitable for the northern England and Scottish markets. A thinner selection of 6-8mm slates, are available for projects where you require a lighter product.

The quarry from this part of Spain produces a well priced heavy slate for ISS, which is perfect for the northern England and the Scottish markets. The Cabrera Grey is an easy slate to work with, being consistent in thickness and quality with minimal visual pyrite content. ISS have marketed the Cabrera Grey in the northern regions of the UK for several years and this slate has enhanced many new build designs as well as matching in with existing roofs on properties that have required remedial attention. The Cabrera Grey is a great all round slate with a very traditional look.

#### Sizes Available:

#### **Testing Results and Design Considerations:**

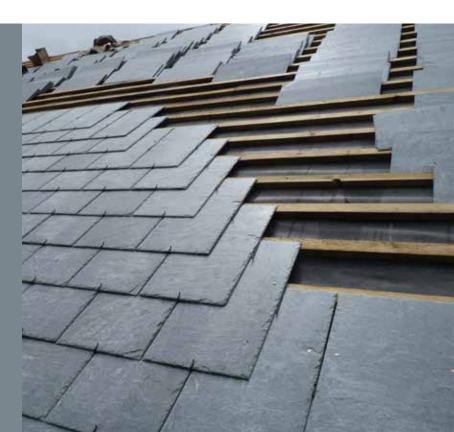

requirements. There are many testing procedures performed on each slate to determine it's quality and life expectancy.

This particular slate is regularly tested to the following national standard:

- British and European Harmonised Standard BS EN 12326-1 2014 Exhibited the top Class A1/W1 for water absorption Exhibited the top Class T1 for thermal cycle resistance Exhibited the top Class S1 for sulphur dioxide exposure resistance
- Good flexural strength both transversely and longitudinally • Acceptable non-carbonate content
- Normal texture using the classifications detailed in BS EN
  12326

A Declaration of Performance (DOP) and full testing results can be provided upon request.

Practice for Slating and Tiling and BS8000-6:2013 Code of Practice for Workmanship on Building Sites - Slating and Tiling, this slate meets the strength requirements for the imposed and uniformly distributed wind and snow loads etc. The site exposure rating and the pitch of roof rafters will determine the size, pattern, lap and fixings for the slates and the following map and associated tables set out site exposure ratings and associated fixing guidelines for the UK and Northern Ireland.

Categories of Exposure to Driving Rain

- Cream areas depict driving rain exposures of less than 56 l/m<sup>2</sup> per spell (moderate)
- Green areas depict driving rain exposures of more than 56 l/m<sup>2</sup> per spell (severe)

ent and in more than general, the above recommendations apply to rafter lengths of no more than 9m in driving rain exposures of less than 56l/m<sup>2</sup> and no more than 6m in driving rain exposures greater than 56l/m<sup>2</sup>. Specifiers should take account of any abnormal conditions that might apply and may need to specify greater values than the recommended minimums. If it is necessary to use pitches lower than the lowest recommended minimums, special precautions should be taken. Slate weights can be provided upon request.

### Roof Design:

- It should be noted that the minimum batten size for rafter spacing up to 600mm for use with natural slates is 50 x 25mm as per BS5534. The ends of any batten should be fully supported and the length of any batten should be no less than 1.2m.
- Traditional Scottish roofing practice consists of covering the roof using square edge sarking boards (in place of battens), covered with an underlay or membrane (as per the architects specification) prior to installing the slates. Buildings have their own unique and individual roof design comprising different elevations and angles to complement the building's architecture. In the interests of aesthetics and to maintain the bond, at all verges, abutments, hips and valleys, alternative slate courses must start with a half width slate or a slate and a half width. Slate and a half widths must be used if the half slate is less than 150mm wide.
- In respect of roof ventilation, the roof space and/or batten cavity must be ventilated in accordance with the latest edition of BS 5250: 2002. ISS can supply in-line ventilation systems to suit most applications including mechanical extraction. Full technical information and support can be provided upon request.

### **Estimating:**

As a natural product, each individual slate may vary slightly in respect of colour and size. As such, it is necessary to add a cutting and wastage allowance in estimating the total number of slates required. For guidance on wastage allowances please contact us.

#### **Preparation:**

As with all natural slates, it is necessary to sort and grade the slates into a minimum of three groups of similar thicknesses prior to fixing. The thickest groups should be used nearest to the eaves, progressing to the thinnest selection nearing the ridge. This will ensure the slates are laid as flat as possible on the roof slope to avoid unsightly gaps or 'kicking' and any associated problems that may occur.

### Fixing:

ISS advocate that slates are fixed using either copper nails or via stainless steel slate hooks.

- Copper nails: slates should generally be twice centrenailed to horizontal battens, except in Scotland, where smaller heavier slates can sometimes be singled nailed (provided every third course is twice nailed). The minimum nail head diameter is 10mm (which means a shank diameter of between 3mm – 3.35mm). The nails should penetrate into the batten by a minimum of 15mm after considering the thickness of two slates (being careful not to penetrate the underlay or membrane). Individual slates should be holed so that the thickest end of the slate is at the tail. Slates should be holed from the underside, which creates a countersink to accept the nail head.
- Hook fixing: one stainless steel spike hook to suit common laps should be used per slate. The minimum recommended pitch for hook fixing is 25°. Below 30°, crimped hooks should be used.
- Slates should be vertically aligned and should allow for a small 'perp' gap between slates of approximately 2mm-5mm in accordance with BS 5534.

### Supply:

ISS products can be supplied direct to site via our network of merchant stockists throughout the UK. Please contact us with any enquiries you may have.
